## ABSTRACT

The Hellenic Armed Forces Formations currently manage all personnel data manually. The authors propose an automated system to perform this function using dBASE II with an IBM personal computer. Source programs and sample reports are included.

## ACKNOWLEDGEMENT

A number of people assisted us during the writing of this thesis.

We would like to express our deep gratitude to CDR L. C. Rawlinson of the Department of Computer Science and LCDR P. Callahan of the Department of Computer Science, too. In addition to giving encouragement, they read through the thesis, suggested improvements and corrections.

## I. INTRODUCTION TO DATABASE CONCEPTS

### A. INTRODUCTION

In recent years computer technology has evolved dramatically. As more and more organizations use computer, it is necessary to use systematic approaches for software solutions to their problems.

One approach which is widely used in the computer world is database systems.

Database systems today, play a central role in computer science for the facilities and data handling capabilities they provide.

Figure 1. Changing Hardware/Software Cost Ratio

The fact that the hardware cost is decreasing rapidly and software cost continues to increase as shown by Figure 1, in a United States Air Force study [Ref. 1], leads us to consider systems that achieve the best utilization of software development productivity. These considerations motivated system designers to build advanced database systems in order to decrease software cost and obtain maximum benefit.

In our case the benefit will be the savings of manpower for other purposes.

#### B. DATABASE SYSTEMS VS MANUAL SYSTEMS IN HELLENIC ARMED FORCES FORMATIONS

Currently all of the information required by Formation Commanders are handled manually by the staff of the formation, resulting in time consuming operations and inaccuracies.

Because of the continuous changes concerning personnel and the associated data, it is extremely difficult for the staff personnel to keep track of these changes. Many systems are very inefficient and the Commander of the Formation does not have accurate and timely information in order to make fast decisions.

These problems could be solved by the implementation of a computerized personnel database system.

A database system has several important advantages over manual systems, which are described below.

First data can be shared. This reduces the time needed to develop new systems or to respond to various requests. In

effect, all the necessary information can be retrieved from existing data much faster and with a higher degree of accuracy.

The second advantage of a database system is the elimination or reduction of data duplication that can lead to a lack of data integrity in conflicting reports.

The third advantage is that the personnel involved in manual personnel management could be reduced considerably, freeing manpower for other tasks.

### C. CONCLUSIONS

In order to increase the effectiveness of Hellenic Armed Forces, it is essential that personnel management be performed very efficiently. However, to manually manage all Armed Forces personnel is a very tedious, complex and time consuming job. Increased personnel volume has also increased the task of management making the operations more and more complicated. Furthermore, personnel managers and decision makers will need reliable information faster than is currently available. It is almost impossible to get all the information required by the personnel managers in the time frame allowed with a manual system.

On the other hand, an automated system could result in decreasing the number of personnel working in personnel management offices, freeing some for manning in other understaffed positions.

Database systems have become important tools for retrieving timely and accurate information and is expected to provide its user with the required information within a specified time. Therefore, a standard database system should be developed for efficient personnel management in the Hellenic Armed Forces Formations.

#### D. GENERAL OVERVIEW OF A DATABASE SYSTEM

We begin with the definition and some of basic terminology of databases and then discuss the architecture and types of data models.

##### 1. Definition and Basic Terminology

Figure 2 shows the relationship between the basic terms of a database, which are explained below.

Figure 2. Relationship Between Basic Terms of a Database

a. Database

A shared collection of interrelated data designed to meet the varied information needs of an organization.

b. Database Management System (DBMS)

A software system that performs all user's requests (update, retrieval) for data.

c. File

Is a collection of records concerning entities of the same type.

d. Record

Is a collection of data concerning one entity of a file. Each record has an identical format.

e. Field

A field is part of the record and is the smallest unit of named data.

## 2. Architecture for a Database System

The architecture is divided into three general levels: internal, conceptual, and external [Ref. 2]. Figure 3 shows the standard viewpoints regarding the three levels.

In Figure 3 a single database, which may be one of many databases using the same DBMS, is viewed at three different levels. Only the physical database exists. The conceptual database is an abstract representation of the physical database and the views are either abstractions or portions of the conceptual database.

Figure 3. Levels of Abstraction in a Database System

### 3. Database Systems vs Traditional File Systems

A database management system (DBMS) is considerably different from a traditional file system.

A traditional file processing approach is shown in Figure 4.

Figure 4. Traditional File Processing Approach

We observe that each file program system processes only its own file.

Figure 5 shows a database processing approach.

Figure 5. Database Processing Approach

Here the DBMS integrates the data and makes it much easier to get useful information from more than one file.

Data is not monitored and manipulated by the individual application programs, but instead by the DBMS.

Such a Database Management System is dBASE II, which will be used as the DBMS in our database system.

The disadvantages of the traditional file approach are:

- (1) Uncontrolled redundancy.
- (2) Inconsistent data.
- (3) Inflexibility.
- (4) Limited data sharing.
- (5) Poor enforcement of standard.
- (6) Low programmer productivity.

(7) Excessive program maintenance.

The advantages of the database processing approach are:

- (1) Minimal data redundancy.
- (2) Consistency of data.
- (3) Integration of data.
- (4) Sharing of data.
- (5) Enforcement of standard.
- (6) Ease of application programs.
- (7) Uniform security, privacy and integrity constraints.
- (8) Data accessibility and responsiveness.
- (9) Data independence.
- (10) Reduced program maintenance.

#### 4. Models of Database Management Systems

A MODEL is a representation of real-world objects, events and their association.

A DATA MODEL is an abstract representation of the data about entities, events, activities and their associations. The purpose of data models is to represent data in understandable terms. The main data models in use today are the hierarchical data model (HDM), network data model (NDM) and the relational data model (RDM) [Ref. 4]. Since the hierarchical model is a special case of the network model, actually there are two types. A complete discussion of these models is beyond the scope of this thesis but a brief overview is important as an introduction to dBASE II.

In a hierarchical or network system, information is stored in a structure that looks very much like a tree (Fig. 6).

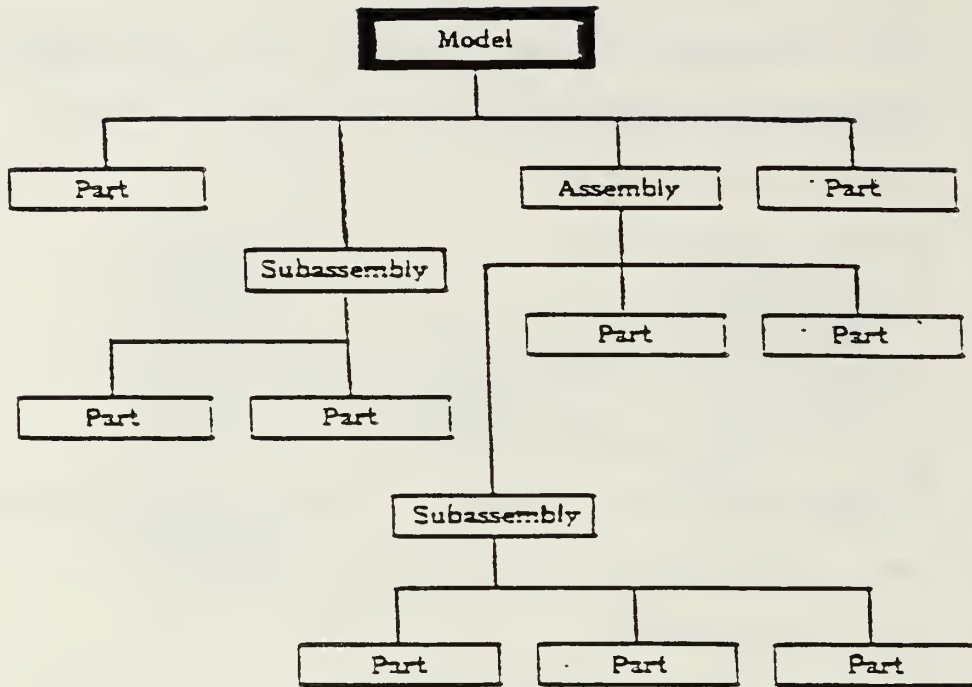

Figure 6. Hierarchical Data Model

An entity is composed of various assemblies and each assembly is composed of various subassemblies which in turn are composed of parts. Each part is a child of the parent assembly or subassembly that owns it. In a hierarchical model no child can have more than one parent.

In a Network model a child can have more than one parent as shown in Figure 7.

It represents data as a set of record types and pairwise relationships between record types.

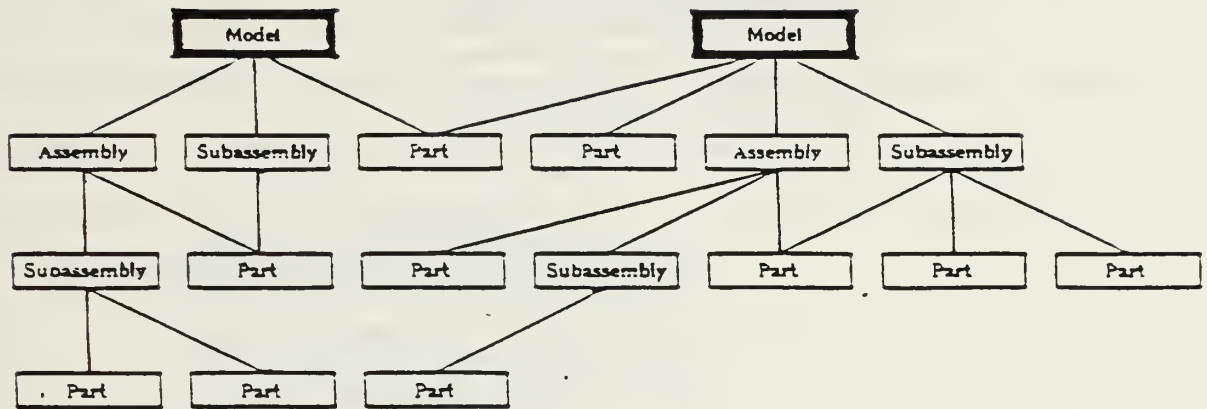

Figure 7. Network Data Model

A relational data model differs from HDM and NDM in architecture. Information is stored in two-dimensional tables which are called files.

These tables which are shown in Figure 8 have the following properties:

- (1) Each column contains values about the same attribute.
- (2) Each column has a distinct name.
- (3) Each row is distinct.
- (4) The sequence of the rows is immaterial.

Figure 8. Relational Data Model

The above scheme deals with a parts inventory system. Information in the tables is accessed by the user based on any desired relationship.

#### E. dBASE II CONCEPTS

dBASE II is a relational database management system. However, since several files are generally used in a given application and the relationship between information in different files is not stored in the system, dBASE II is not a true database management system in the strictest sense of

the word. dBASE II is more like a file management system with relational features added. dBASE II does contain its own programming language, permitting a user to develop extremely powerful and complex programs that meet demanding applications like general personnel, accounting and inventory control.

#### 1. Features of dBASE II [Ref. 4]

The most important features of dBASE II are:

- a. Independence of programs and data. Changes in file structures do not affect programs.
- b. Data can be easily updated.
- c. Sorting and indexing capabilities.
- d. Easy creation of reports by the report generator facility, or under program control.
- e. Very high-level built-in language which supports structured programming.

#### 2. Limitations of dBASE II [Ref. 3]

a. dBASE II allows only two files to be open at a time. This creates difficulties which can be overpassed by using special techniques but the system will slow down.

b. dBASE II allows only 32 fields per record, which is enough for most applications, and the maximum number of characters permitted per record is 1000.

c. Each field can be up to 254 characters long.

d. dBASE II allows 16 programs to be run at any given time, reduced by the number of data files in use. For example, if we have 2 files in use, then 14 programs are allowed.

e. dBASE II applications are slower than compiled programs.

## II. ANALYSIS PHASE

In this chapter the analysis phase for our personnel database system is discussed. This phase includes the definition of the system objectives, the definition of the output information needed to meet these objectives, the definition of output forms, and definition of input information needed to obtain the desired output.

### A. SYSTEM OBJECTIVES

As we stated in the previous chapter personnel management in Hellenic Armed Forces Formations is handled manually. This results in time consuming operations, inefficiency, and inaccuracy, which in turn results in a need for additional personnel, leaving other serious positions unmanned. In addition, decision making may be late which could result in disorder as far as personnel management is concerned.

From the above discussion it is evident that a computerized system for handling personnel is needed.

With such a system it will be possible to have any information concerning personnel updated at any time, with less effort and maximum accuracy. This will result in better decision making, faster operations and a savings of personnel for other purposes.

More specifically we will consider the following objectives for the system [Ref. 7].

- (1) Application development must be easier, cheaper, faster and more flexible.
- (2) The data may have multiple uses.
- (3) Clarity.
- (4) Ease of use.
- (5) Flexible usage.
- (6) Ease of change.
- (7) Low cost.
- (8) Performance.
- (9) Privacy.
- (10) Availability.
- (11) Reliability.

#### B. OUTPUT INFORMATION

Our database system can be applied to all the personnel of a formation but for the purpose of this thesis we will include only the officers.

To meet the above objectives the following output information is needed:

- (1) List of officers in alphabetical order including serial number, rank, unit, and report date.
- (2) List of officers ordered by rank including service entry date, unit and duty.
- (3) List of units with their officers.
- (4) List of officers with nonmilitary studies.
- (5) List of officers who speak foreign languages.
- (6) List of officers including marital status.
- (7) List of officers with service time in current unit and total service time.

- (8) List of officers with their addresses and phone numbers.

The above lists will be issued regularly every month, but they will also be available at any time.

### C. INPUT INFORMATION

In order to keep track of all the officers belonging to a Formation we must consider the following:

Each officer has a serial number, rank, duty, and he belongs to a unit. We need to know his total service time, and the service time in current unit, as well as his marital status and where he lives, in order to respond to queries in the case of emergencies.

Each unit has several officers and is identified by a code number which is distinct for Army and Navy units.

For security purposes the personnel data contained within this thesis is purely artificial.

In addition, we need to know, the education of each officer, including non-military studies and foreign language knowledge. For the purpose of this thesis, we assume that each officer speaks at most one foreign language besides his mother tongue.

A detailed description and the input information included in the files, which will be created to support the above needs, are provided in the design phase.

### III. DESIGN PHASE

In this phase the functions of the system are defined, the files of the database are designed and a collection of programs is defined, to support each function.

#### A. SYSTEM FUNCTIONS

The system is separated into three functional entities as follows:

##### 1. Update Operations

This function allows the user to enter, delete and modify records in all the supporting files. These operations are performed daily.

##### 2. Report Generators

This function is for retrieving all the necessary information from our database on a monthly basis, or upon request.

##### 3. Miscellaneous

This function will include the following:

a. When a user enters the system to do a specific job a record is automatically created containing the name of who makes the change, the date of the change, and the kind of the job. This file can be printed and deleted as necessary to monitor changes.

b. When an officer is to be deleted from the MASTER file, before the deletion operation is performed, some data

concerning this officer will be transferred to a statistical file including the serial number, the name, the unit, the rank, the report date in the unit, and the date of deletion. This file will be available yearly or upon request.

c. A screen display or printer output for fast retrieval of the data concerning an officer.

The functional blocks of the system are shown in Figure 9.

Figure 9. Functional Blocks of the System

## B. FILE DESIGN

To support the above functions the following files with the corresponding structures were created. The names of the files and fields are the ones that are used in our programs.

### 1. Master File

It is the main file for our system containing the necessary information for each officer.

Structure for file: MASTER

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	SERNO	C	4
02	NAME	C	16
03	RANK	C	2
04	UNIT	C	4
05	SERENTRY	N	6
06	REPTDATE	N	6
07	DUTY	C	2
08	EDUCAT	C	2
09	DEGREE	C	1
10	FORLANG	C	2
11	MARSTAT	C	1
12	CHILDREN	C	1
13	ADDRESS	C	20
14	PHONE	C	7

Primary key: SERNO

2. Units File

Structure for file: UNITS

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	CODE	C	4
02	TITLE	C	12
03	LOCATION	C	10

Primary key: CODE

### 3. Ranks File

Structure for file: RANKS

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	CODE	C	2
02	ARMYNAME	C	4
03	NAVYNAME	C	4

Primary key: CODE

### 4. Duties File

Structure for file: DUTIES

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	CODE	C	2
02	NAME	C	20

Primary key: CODE

### 5. Forlangs File

Structure for file: FORLANGS

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	CODE	C	2
02	NAME	C	12

Primary key: CODE

### 6. Sciences File

Structure for file: SCIENCES

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	CODE	C	2
02	NAME	C	15
Primary key: CODE			

#### 7. Monitor File

It is a file that keeps track of who does what and when.

Structure for file: MONITOR

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	DATE	C	8
02	NAME	C	16
03	JOB	C	12
04	FLE:REPT	C	12
05	NUMREC	N	3

#### 8. Statistic File

It is the file for statistical information for each deleted officer.

Structure for file: STATISTIC

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	SERNO	C	4
02	NAME	C	16
03	RANK	C	2
04	UNIT	C	4
05	REPTDATE	C	8
06	DELDATE	C	8

## 9. Tempor File

Structure for file: TEMPOR

<u>FIELD</u>	<u>NAME</u>	<u>TYPE</u>	<u>WIDTH</u>
01	PASSWORD	C	5
02	SELECT	C	2
03	COUNTER	C	3

### C. EXPLANATION OF FIELDS

The explanation of the fields, where not obvious, is given below:

#### 1. Master File

- a. SERNO: The serial number of the officer.
- b. SERENTRY: The date he entered the military academy.
- c. REPTDATE: The date he was positioned in the current unit.
- d. EDUCAT: His education besides the military studies.
- e. FORLANG: Foreign languages he speaks.
- f. MARSTAT: His marital status.

#### 2. Monitor File

- a. FLE:REPT: The file the user works with, or the kind of report he prints.

#### 3. Statistic File

- a. SERNO, REPTDATE: The same as above.
- b. DELDATE: The date of deletion from the unit.

#### D. DATA FLOW DIAGRAM

The update operations are performed daily to update all the files of the system. These operations include insertion and deletion of records, as well as modifications in one or more fields. The output of the update operations are the same files updated from the transactions of the day. These files are then used as input by the report generator function, to obtain the various reports.

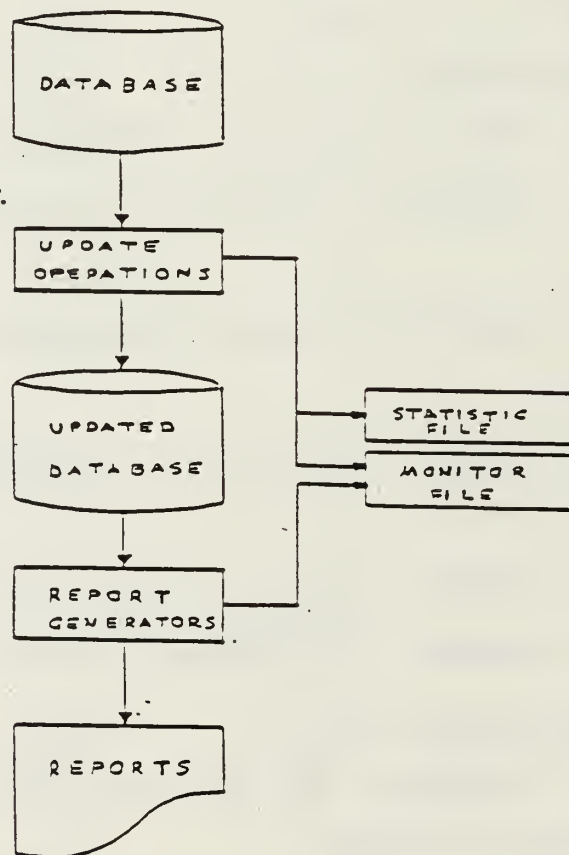

Figure 10. Data Flow Diagram for the Personnel Database System

During the update operations the STATISTIC file is created automatically.

The MONITOR file is created from the update operations, report generators, and miscellaneous operations.

The STATISTIC and MONITOR files are not seen by the user, so supporting the information hiding principle.

The data flow diagram of the system is shown in Figure 10.

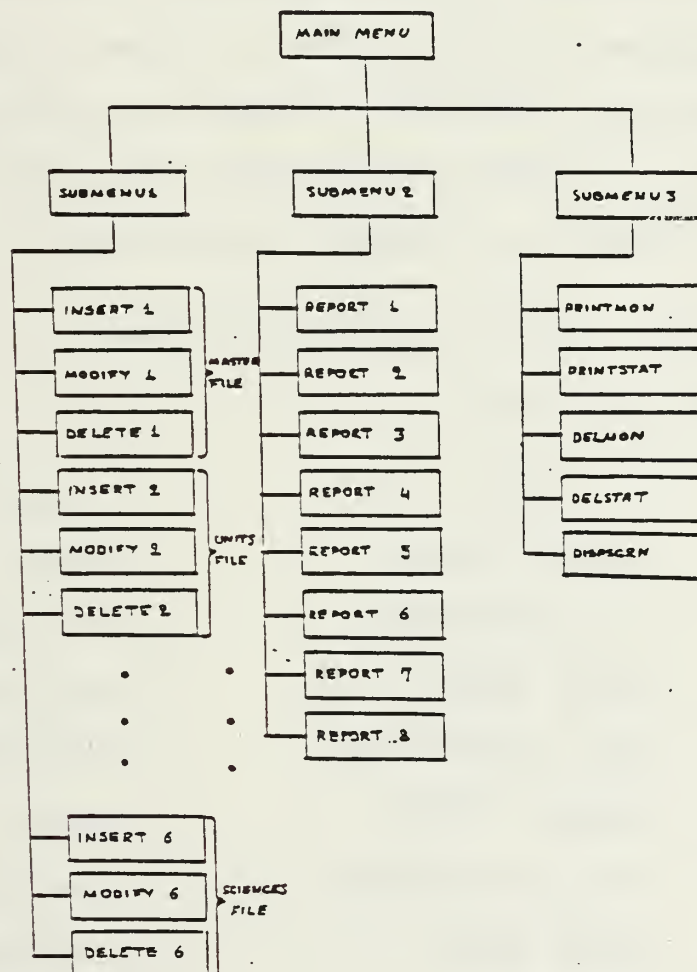

Figure 11. Program Map for the Personnel Database System

## E. SUPPORTING PROGRAMS

The functional blocks we have already defined are selected by the user from the main menu of the system. The control is then transferred to the corresponding submenu (one for each function). From the submenus the appropriate job is selected from an option list. The main menu, submenus, and programs form a hierarchical relationship. The diagram of this relationship is the program map. The program map for the personnel database system is shown in Figure 11.

All the update operations, reports and printing, as well as deletion of MONITOR and STATISTIC files are selected from SUBMENU1, SUBMENU2, and SUBMENU3 respectively.

## F. CODE SYSTEM FOR THE PERSONNEL DATABASE

### 1. Codes for Ranks

<u>CODE</u>	<u>ARMY</u>	<u>NAVY</u>
01	GENERAL (GEN)	ADMIRAL (ADM)
02	LT GENERAL (LTG)	VICE ADMIRAL (VADM)
03	MAJOR GENERAL (MG)	REAR ADMIRAL (RADM)
04	BRIG GENERAL (BG)	COMMODORE (COMD)
05	COLONEL (COL)	CAPTAIN (CAPT)
06	LT COLONEL (LTC)	COMMANDER (CDR)
07	MAJOR (MAJ)	LT COMMANDER (LCDR)
08	CAPTAIN (CPT)	LIEUTENANT (LT)
09	FIRST LIEUTENANT (1LT)	FIRST LIEUTENANT (1LT)
10	SECOND LIEUTENANT (2LT)	ENSIGN (ENS)

## 2. Codes for Units

<u>CODE</u>	<u>TITLE</u>
1000	1st Inf Div
1101	1st Inf Bn
1102	2nd Inf Bn
1103	3rd Inf Bn
1104	4th Inf Bn
1105	5th Inf Bn
1206	1st Arty Bn
1207	2nd Arty Bn
1308	Armour Bn
1409	Engineers Bn
1510	Signals Bn
1611	Sup/Trans Bn
2000	Navy Forces
2101	DD Squadron
2202	LST Squadron
2103	DD Miaoulis
2104	DD Kanaris
2105	DD Themis
2206	LST Argo
2207	LST Rhodes

The meaning of the four digits representing the codes of the units is as follows:

1ST digit

1: ARMY

2: NAVY

2ND digit

It distinguishes between the various kinds of units  
as follows:

ARMY

0: HEADQUARTERS

1: INFANTRY

2: ARTILLERY

3: ARMOUR

4: ENGINEERS

5: SIGNAL

6: SUPPLY-TRANSPORTATION

NAVY

0: COMMAND

1: DD SQUADRON

2: LST SQUADRON

The 3rd and 4th digit specify each unit.

3. Codes for Duties

CODE

NAME

01

COMMANDER

02

DTY COMMANDER

03

CHIEF OF STAFF

04

1st OFFICE MANAGER

05	2nd OFFICE MANAGER
06	3rd OFFICE MANAGER
07	4th OFFICE MANAGER
08	COMPANY COMMANDER
09	BATTERY COMMANDER
10	COMMANDING OFFICER
11	EXECUTIVE OFFICER
12	ASW OFFICER
13	NAVIGATION OFFICER
14	COMMUNICATION OFFICER
15	CIC OFFICER
16	ADJUTANT

4. Codes for Sciences

<u>CODE</u>	<u>NAME</u>
01	MATHEMATICS
02	PHYSICS
03	CHEMISTRY
04	AERONAUTICS
05	EL/ENGINEERING
06	MECH/ENGINEERING
07	ECONOMICS
08	OPER/RESEARCH
09	INFO/SYSTEMS
10	COMP SYSTEMS
11	COMP SCIENCE
12	MANAGEMENT

13	WEAPONS
14	OCEANOGRAPHY
15	SHIPBUILDING
16	METEOROLOGY
17	MEDICINE
18	LEGAL SCIENCES
19	ARCHITECTURE
20	CIV ENGINEERING

5. Codes for Education Degree

<u>CODE</u>	<u>NAME</u>
B	BACHELOR
M	MASTER
P	Ph.D

6. Codes for Foreign Languages

<u>CODE</u>	<u>NAME</u>
01	ENGLISH
02	GERMAN
03	ITALIAN
04	FRENCH
05	SPANISH
06	TURKISH
07	ARABIC
08	JAPANESE
09	CHINESE
10	PORTUGUESE
11	RUSSIAN

12	BULGARIAN
13	KOREAN
14	DANISH
15	SWEDISH
16	DUTCH

7. Codes for Marital Status

<u>CODE</u>	<u>NAME</u>
M	MARRIED
U	UNMARRIED
D	DIVORCED

#### IV. IMPLEMENTATION PHASE

##### A. MAIN MENU AND SUBMENUS OF THE SYSTEM

###### 1. Mainmenu

This program controls the whole operation of the system, and is called from another program called BEGIN, which is the only program the user calls by name. The program BEGIN also sets drive B to be the default drive. After initializing basic dBASE II functions the program MAINMENU calls another program called PASSWORD which is for aborting unauthorized users, and then it proceeds by displaying the front page of the system. Then it displays on the screen the main menu of the system, and pauses waiting for the user to make his choice which is stored in the variable 'choice'. Then a CASE statement permits the program to branch to the corresponding SUBMENU, or exit either to the operating system, or to dBASE II. If the user selects a wrong choice, then the program prints an error message, rings the bell, and redisplay the screen. This is performed by a WHILE loop using the boolean value T.

###### 2. Password

This program is called by the MAINMENU once at the beginning. Each user has a password to enter the system. If the password is the right one, the user is allowed to continue, otherwise the program gives one more change. If

the password is wrong again, the program automatically exits to dBASE II, displaying the appropriate message.

During the execution of this program, we have to store somewhere the password to be used by the MONITR program, for monitoring the changes. This is done by using a file called TEMPOR with three fields, password, select, and counter. This file contains only one record, which is modified properly during execution of the programs PASSWORD, and SUBMENUS. The MONITR program is called from the programs INSERT, DELETE, MODIFY, REPORTS, and MISCELLANEOUS.

### 3. Submenus

All three SUBMENUS operate with the same logic as the MAINMENU. The screen displays guide the user in what to do in each case. These programs also store in the second field of the file TEMPOR, the selection made by the user.

The listings of the programs are given in the next pages.

## B. PROGRAMS IMPLEMENTING THE UPDATE OPERATIONS

These programs permit the user to perform insertions, deletions, and modifications in the files of the database.

### 1. Insertion Programs

These programs are for adding records to the database files. The structure of all the programs follow the same logic, so we will describe only the program which adds records to the MASTER (PERSONNEL) file.

The whole structure of the program is as follows:

- a. The MASTER file is opened.
- b. The user is prompted to enter the new serial number or a blank in order to exit to SUBMENU1, when he is finished.
- c. The program searches the MASTER file for the new serial number. If it already exists, prints an error message and gives another chance, otherwise it proceeds.
- d. The proper memory variables, in which the new values are to be stored, are initialized to blanks. For simplicity the names of the memory variables are the same as the corresponding field names with the prefix 'm', which stands for memory. This holds throughout the whole system.
- e. Then the program displays on the screen the new serial number, the names of the fields and the corresponding blank space. Then the user can enter the new values. Again the user has the opportunity to exit by pressing 'ENTER'.

f. Then a blank record is appended to the MASTER file and each field is replaced with the corresponding memory variable.

g. The whole operation is repeated within a WHILE loop, until the user exits.

h. The program MONITR which is for monitoring every job done in the database, is called only once before the program exits from either of the three possible exits, and after the number of changes is stored in the field 'counter' of the file TEMPOR. This is performed in all the programs that need to monitor the job done in the database.

The listings of the programs are given in the following pages.

\*\*\*\*\* PROGRAM INSERT1 \*\*\*\*\*

## 2. Deletion Programs

These programs are for deleting records from the files of the database. Again we will describe only the program that performs deletions from the MASTER file since all the other programs have the same structure.

The structure of the program is as follows:

- a. The MASTER file is opened.
- b. The user is prompted to enter the serial number, which is the key value of the record to be deleted. He can also exit by pressing 'ENTER'.
- c. When the user exits after he is finished, that is, after several deletions have been made, then the number of deletions which is kept in the variable 'count', is transferred to the field 'counter' of the file TEMPOR. Then the program MONITR is called to record the changes. If the user exits at the beginning, that is, without doing anything, then the program returns to SUBMENU1.
- d. The MASTER file is searched for the serial number. If the record does not exist, the program prints an error message, and gives another chance. If the record exists, then it is displayed on the screen.
- e. At this point the user is asked to confirm the deletion. If he is sure that the record must be deleted, he has just to enter 'Y', and the deletion operation is performed, otherwise he has to enter 'N' to abort the deletion. Then the program loops, repeating the whole operation.

The listings of the programs are given in the next pages.

### 3. Modification Programs

These programs modify records in the files of the database. Since the structure of all the programs is the same, we will describe only the program MODIFY1 which makes changes in the MASTER file.

The structure of the program is as follows:

- a. The MASTER file is opened.
- b. An appropriate message is displayed on the screen, prompting the user to enter the serial number of the officer whose record is to be modified. At this point he may exit the program by pressing 'ENTER', either after he has made the modifications he wants, or at the beginning, without having done anything. In the latter case the program just returns to SUBMENU1. In the former case the program updates the MONITOR file and then returns. Before the program exits, it closes the MASTER file.
- c. The MASTER file is searched for the serial number. If the record does not exist, the program displays an error message, and loops giving another chance.
- d. If the record exists, then the field values are stored to temporary memory variables, and the record is displayed on the screen.
- e. Now the user can modify any field he wants, by moving the cursor and overwriting the existing values.
- f. When he is finished, the old field values are replaced by the modified memory variables, and the record is placed back in the file.

g. The whole operation continued under the control of a WHILE loop, until the user exits.

The listings of the programs are given in the following pages.

## C. REPORT GENERATORS

These programs permit the user to print all the necessary reports which must be available to the Commander, in order to help him in his decision making. The documentation, listing, and output of each program is as follows:

### 1. Program Report1

This program prints all the officers in alphabetical order including name, serial number, rank, the unit he belongs, and the report date.

The program uses the following structure:

- a. The necessary memory variables are initialized and the heading of the report is printed.
- b. The MASTER file is opened, and is sorted on the key 'name' to the temporary file TEMP, in ascending order.
- c. The program uses the sorted file TEMP, and executes a WHILE loop to process each record of the file.

Within the WHILE loop the program performs the following:

- (1) Stores the appropriate field values to the corresponding memory variables.
- (2) Searches RANKS and UNITS files and retrieves the appropriate rank name and the title of the unit.
- (3) The main line of the output is printed.

This line includes the data concerning the officer whose record is being processed. A line counter is kept to control the paging of the output.

d. The program continues with the next record until the end of file (EOF) is encountered.

e. The file TEMP is deleted, and the MONITOR file is updated.

The program listing and output is shown in the next pages.

\*\*\*\*\* PROGRAM REPORT1 \*\*\*\*\*

## 2. Program Report2

This program prints all the officers ordered by rank, and within the rank by unit, including name, unit, and duty.

The structure of the program is as follows:

a. The necessary memory variables are initialized and the main heading of the list is printed.

b. We create a copy of the MASTER file into file TEMP, which includes only the fields necessary to obtain the output.

c. Since dBASE II cannot sort a file on more than one key at the same time, we do two consecutive sorts. The first one is done on the minor key 'unit', and the second one on the major key 'rank'. For the purpose of these sorts we use the temporary files TEMP1 and TEMP2 besides TEMP.

d. Using the file TEMP2 which is double sorted on the desired keys, the program performs a WHILE loop to process this file, with the following major functions:

(1) The field "rank" and the first character of the unit code are compared to the memory variables 'mrank' and 'funit' respectively. If either comparison yields a 'false' value this means that an officer of the different rank or different service has been encountered. The value of the field 'rank', and the first character of the unit code, are stored to the above memory variables, in order to be ready for the next comparison. Then the heading of the new rank is printed.

(2) The current field values are stored to the corresponding memory variables.

(3) The appropriate unit title, and duty name are retrieved from the files UNITS and DUTIES respectively.

(4) The main line of the output is printed, and the program proceeds to the next record.

e. The MONITOR file is updated, all the temporary files are deleted, and then the program returns to SUBMENU2.

The listing and output of the program are shown in the next pages.

### 3. Program Report3

This program prints all the units and the officers who belong to a particular unit, including name, rank, and duty.

The structure of the program is as follows:

- a. The necessary memory variables are initialized and the headlines are printed.
- b. A copy of the MASTER file is created which includes the fields, serial number, name, rank, unit, and duty. This file then is sorted by unit, and within the unit by rank.
- c. The above finally sorted file, is processed sequentially within a WHILE loop, whose function is the following:

- (1) The field 'unit' is compared to the field 'unit' of the previous record. If they are not equal, this means that a new unit has been encountered. Then the program prints the title and location of the unit.

- (2) The rank and duty names are retrieved from the corresponding files, and the main line of the output is printed.

- (3) The program proceeds with the next record.

- d. Before the program returns, it updates the MONITOR file, and deletes the temporary files.

The listings and the output of the program are shown in the next pages.

#### 4. Program Report4

This program prints all the officers who have been awarded a degree in the sciences with an emphasis other than military sciences. This list includes name, rank, science, and degree, and is sorted by name.

The structure of the program is as follows:

- a. The necessary memory variables are initialized and the heading of the report is printed.
- b. The program uses two temporary files, TEMP1 and TEMP2. The MASTER file is used to create a copy into TEMP1, which includes only the necessary fields, serial number, name, rank, education, and degree. Only the officers whose the field 'educat' is not empty are copied. Then the file TEMP1 is sorted on key 'name' into the file TEMP2.
- c. Then the program performs a WHILE loop to process each record of the file. More specifically within the WHILE loop it performs the following:
  - (1) Stores the current field values to the temporary memory variables.
  - (2) Retrieves from RANKS and SCIENCES files the appropriate rank name and science name respectively.
  - (3) A CASE statement is executed to store the appropriate degree to the corresponding variable.
  - (4) The main line of the output is printed.
- d. The program proceeds with the next record until the end of file (EOF) is encountered.

e. Before the program returns it deletes the temporary files TEMP1 and TEMP2, and updates MONITOR file.

The listing and output of the programs are shown in the next pages.

## 5. Program Report5

This program prints all the officers who speak foreign languages. The list is sorted by language and name and, includes the language spoken as a heading, name, rank, and unit.

The structure of the program is as follows:

- a. The necessary memory variables are initialized.
- b. A list of all the languages is displayed on the screen and the user is prompted to select a particular, or all the languages to be printed.
- c. Depending on the user's choice the program creates a copy fo the MASTER file to temporary file TEMP which includes all the officers who speak any or a particular language. If the user enters a wrong selection, the program goes back to step (b).
- d. The main heading of the output is printed.
- e. If the user decides to print all the languages, then, the program sorts the created copy on ascending keys 'forlang' and 'name' into file TEMP2, and a WHILE loop is executed to make the process which includes:
  - (1) The file TEMP2 is read sequentially. The field 'forlag' is compared to the variable 'lang' which contains the value of the field 'forlag' of the previous record. If it is different, this means that we have a new language, whose name is printed as a heading.

(2) The program retrieves the rank and unit names, from the corresponding files, and prints the main line of the output.

(3) The process is continued with the next record.

f. If the user decides to print a particular language, the corresponding language heading is printed, and the previously created copy is sorted by name, into TEMP1.

g. Then a WHILE loop is executed which performs the same things as above, except the comparison, because now we have only one language.

h. At the end all the temporary files are deleted, the monitor file is updated, and the program returns to SUBMENU2.

The listing and output of the program are shown in the next pages.

## 6. Program Report6

This program lists all the officers in alphabetical order, including name, rank, marital status, and number of children.

The program has the following structure:

- a. The appropriate memory variables are initialized and the main titles are printed.
- b. We use two temporary files, TEMP1 and TEMP2. The first one is used for creating a copy from MASTER file, and which includes, serial number, name, rank, marital status, and number of children, i.e. only the necessary information for creating the report. Then this file is sorted by name into the file TEMP2.
- c. Then the main process of the program is executed within a WHILE loop with the following functions:
  - (1) The current field values are stored to the memory variables.
  - (2) The appropriate rank name is retrieved from RANKS file and marital status is stored to the corresponding variable, depending on the value of the field 'marstat', of the file TEMP2.
  - (3) Then the program prints the main line and proceeds with the next record.
- d. At the end of the WHILE loop the program deletes the files TEMP1 and TEMP2, and then returns to the calling program.

The listing and output of the program are shown in the next pages.

## 7. Program Report7

This program calculates the service time in the current unit, as well as the total service time for each officer. The output of the program is directed to the printer only, while appropriate messages are displayed on the screen to inform the user of what is going on at the various steps of the program.

The structure of the program is as follows:

- a. The necessary memory variables are initialized and the headlines are printed.
- b. The MASTER file is copied to the file TEMP including only the fields 'name', 'serentry', and 'reptdate'. Then this file is sorted by name to the file TEMP1, which is used for the main process.
- c. The program performs a WHILE loop to do the following:
  - (1) In order to do the calculations the proper way, we have to transform the format of the dates from MM/DD/YY to YY/MM/DD.
  - (2) We calculate the service time in current unit as follows: The day of the report date, is compared to the day of the day of the current date. If it is greater, we add 30 days to the day of the current date, and subtract 1 from the month of the current date, otherwise they remain unchanged. Then the month of report is compared to the month of the current date, either unchanged or reduced by 1

as mentioned before. If it is greater we add 12 to the month of the current date and subtract 1 from the year of the current date, otherwise remain unchanged. This way we make sure that the subtraction is possible. We do the operation storing the number of years, months, and days to memory variables.

(3) With the same logic we calculate the total service time.

(4) The program prints the main line, reinitializes the proper memory variables to accept the new values, and continues with the next record.

d. At the end the MONITOR file is updated, the temporary files are deleted, and the program returns.

The listing and output of the program are shown in the next pages.

## 8. Program Report8

This program prints all the officers in alphabetical order including name, rank, address, and phone #.

The structure of the program is as follows:

- a. The necessary memory variables are initialized and the main heading is printed.
- b. The MASTER file is sorted into the temporary file TEMP in alphabetical order, with key the officer's name.
- c. The program performs the main process within a WHILE loop which includes:
  - (1) Storing the appropriate field values to the corresponding memory variables.
  - (2) Retrieving the appropriate rank name from RANKS file.
  - (3) Printing the main line of the output, and proceeding with the next record.
- d. The temporary file TEMP is deleted, the MONITOR file is updated, and then the program returns.

The listing and output of the program are shown in the next pages.

#### D. MISCELLANEOUS OPERATIONS

These are auxiliary operations, which have been included in our Database System, to provide the Commander of a Formation and the aiding personnel, some statistical information about any work done in the database, as well as, some information concerning officers deleted from the current Unit. This information is recorded automatically during the whole operation of the database, in the files MONITOR, and STATISTIC, respectively. These files can be printed or deleted upon request. In addition, we have included in this function, a screen display, or printer output, of all the data concerning an officer.

The programs implementing this function of the system, with a short description of what each performs, are given below:

1. Program Printmon

This program prints the MONITOR file, which keeps track of who does what and when.

2. Program Printstat

This program prints the STATISTIC file, which contains some information about the officers who have been deleted from their previous Unit.

3. Program Delmon

This program deletes the data from the MONITOR file.

4. Program Delstat

This program deletes the data from the STATISTIC file.

## 5. Program Dispscrn

This program displays on the screen, or prints, depending on the user's choice, all the information included in an officer's record.

The listings of the above programs, as well as, the output if any, are shown in the next pages.

## V. CONCLUSIONS AND RECOMMENDATIONS

In this thesis, we tried to develop a personnel database system model, suitable for implementation within the Hellenic Armed Forces Formations. This system could also be applied to any subdivision of the Hellenic Armed Forces hierarchy, with only slight modification.

Our main goal is to increase productivity, effectiveness, efficiency, accuracy, and speed, as far as personnel management is concerned, as well as to decrease the national expenditure, and release manpower for other purposes. Also, the Commander of a Formation will be able to make fast decisions concerning personnel, which is important as well.

We used dBASE II as a database management system, since it is based on the relational model, which increases independency, and reduces redundancy. In addition, dBASE II contains its own programming language, which is a structured, high-level language, which is generally very efficient for manipulating data in the database.

We have implemented the most usually needed reports, but a wide variety of other reports, or simple queries, could also be created. Also, we tried to keep the programs as user friendly as possible, in order to help, not hinder, the operators in their job.

The software life cycle has been taken into account during the program development process. Programs are easy

to modify to meet future improvement needs. In our application we have used the top-down design approach which serves the above goal.

In this implementation we have included only officers, and a certain amount of data for each of them. Future improvements could include the entire military personnel, and we could add more information to the record of each individual, such as place and date of birth, medical information, military education, and statistical information concerning the units he has been assigned up to the present time, to name just a few.

This thesis constitutes a good basis for the future computerization of personnel management, in the Hellenic Armed Forces Formations, as well as in subordinate units.
